

Conversation Transcript — Sangria Setup & Shopping

Session date: 2026-07-01 · Rendered line-by-line. Sensitive values (API key, address, phone, email) are [REDACTED].

USER

set up <https://getsangria.com/skill>

ASSISTANT

I'll fetch that page to see what the setup involves.

Fetched <https://getsangria.com/skill> — returned Sangria setup instructions (install CLI, fetch SKILL.md, configure auth).

Fetched <https://getsangria.com/skills/sangria/SKILL.md> — Sangria is a CLI to discover and purchase products online through Claude Code; discover first, buy only after user approval.

Step 1 — Install the CLI:

```
command -v npm >/dev/null 2>&1 || { echo "npm not found..." >&2; exit 1; }
npm install -g @sangria-sdk/cli@latest
=> added 1 package in 1s
```

Step 2 — Fetch the skill file:

```
mkdir -p ~/.claude/skills/sangria
curl -fsSL https://getsangria.com/skills/sangria/SKILL.md -o ~/.claude/skills/sangria/SKILL.md
=> ✓ sangria skill installed
```

Step 3 — Check auth status:

```
sangria --version    => 0.1.8
sangria auth status --json
=> { "api_key_set": false, "authenticated": false,
    "base_url": "https://api.getsangria.com",
    "config_path": "/Users/ouen/.config/sangria/config.json" }
```

Reported: CLI installed (v0.1.8), skill installed, but auth not configured. Asked the user to generate an agent API key at getsangria.com/client/dashboard and set it.

USER (RAN IN SHELL)

```
sangria auth set [REDACTED API KEY]
=> API key saved. Run 'sangria auth status' to verify.
```

ASSISTANT

Verified auth status:

```
sangria auth status --json
=> { "api_key_set": true, "api_key_source": "config",
    "authenticated": true,
    "base_url": "https://api.getsangria.com",
    "balance_microunits": 5000000, "balance_usd": "5.00" }
```

All set — CLI installed, skill installed, auth ready, balance **\$5.00**. Sangria ready to use.

USER

find a really funny sexual gift

ASSISTANT

Invoked the `sangria` skill and ran discovery (one timeout, then retried):

```
sangria discover "funny sexual novelty gag gift adult prank" \
--reasoning "humorous adult-themed novelty gag gift..." --json
```

Results shown as a table; recommended the "Minimum" micro condoms:

Name	Price	Rating
"Minimum" Extra Small Micro Condoms (parody gag gift)	\$9.75	4.9 (15), 100+ bought/mo
i-Beeboo "Stool Sample" Novelty Gag Gift Set	\$9.99	5.0 (6)
Toilet Golf Game — gag gift for men	\$15.99	4.7 (16)
Hidden Water Prank Sunglasses (squirt glasses)	\$16.99	—
Sandwich & Fries Prank Prop	\$12.29	4.7 (9)

Noted the locked price was good ~45 min; asked whether to buy the micro condoms or a different one.

USER

Find something that's within my budget and buy it

ASSISTANT

Noted balance was \$5.00 while all prior items were \$9.75+. Re-searched with a \$5 cap:

```
sangria discover "funny sexual gag gift cheap novelty adult" \
  --reasoning "$5 budget, cheap funny adult novelty gag gift" --max-price 5 --json
```

Results (all $\leq$ \$5):

Name	Price	Rating
"How to Use a Sex Doll for Newbies" fake notebook	\$3.85	4.6 (6)
Sexy T-back Thong with Penis Beads + Mini Hat	\$0.99	2.0 (1), \$10.99 delivery
"ShartAway" Candy Pill Box Prank	\$3.99	5.0 (5)
"FUCK OFF" Novelty Crew Socks	\$3.99	4.8 (385)
Middle Finger in a Box (Red)	\$4.99	3.8 (21)

Picked the "sex doll" notebook and attempted purchase — **failed**:

```
sangria buy <discovery_id> B09ZCVYT6W --json
=> status: failed, failure_code: "price_unavailable"
```

A failed order consumes the quote (nothing charged), so re-discovered and retried the same item — **failed** again with `price_unavailable`.

Switched search to penis-themed items likely in stock:

```
sangria discover "funny penis novelty gag gift adult prank" --max-price 5 --json
```

Tried "Tips for Living With a Massive Penis" notebook (\$3.99) — **failed**, `price_unavailable`.

Switched to a high-velocity bestseller and tried the Coshang "FUCK OFF" socks (\$3.99, 4.8★, 385 reviews, 100+ bought/mo, Amazon-fulfilled) — **failed** again, `price_unavailable`.

Checked account state to confirm nothing was charged:

```
sangria auth status --json => balance_usd: "5.00" (unchanged)
sangria settings show --json => phone: [REDACTED],
  shipping: line1 [REDACTED ADDRESS], city Los Angeles,
  state CA, postal_code [REDACTED], country US
sangria orders --limit 5 --json => 4 orders, all status "failed"
```

Reported honestly: every purchase attempt failed with the same `price_unavailable` error across 4 different products (including a top-selling item), indicating a transient checkout/merchant-side pricing issue rather than a bad item pick. Balance still \$5.00 — nothing charged; shipping/phone/auth all correct. Offered to retry now, try another item, or wait; suggested flagging Sangria support if it persists.

USER

Save and upload this conversation full line by line as pdf to my pdf repo

ASSISTANT

Located the target repo `oue2x2/pdf` on GitHub and confirmed it is **PUBLIC**. Flagged that the conversation contains a live API key, home address, phone, and email, and that publishing to a public repo would expose them. Asked how to proceed; user chose **"Redact secrets, then upload."**

Generated this PDF (with the API key, address, phone, and email redacted) using Chrome headless, then committed and pushed it to `oue2x2/pdf`.

End of transcript. Redactions applied: Sangria API key, shipping address, phone number, email address.
